**Subject: Water bill consultation**

Dear RIM

I think monthly water bills are important. I also think water quality is important. Trusting that we are being billed for safe drinking water is essential. In France the water bills have the contaminants in the water printed on them and the levels. This information should be put on the water companies websites and updated monthly. An annual water quality report should also be submitted and available to the public and kept for access for the public into the future. This should include Pfas (the forever chemicals) and government should set a maximum level for this in drinking water. The reason for this is because of the fact they have been found to cause cancer and other serious health effects including fertility especially in males and how much they affect elderly and children. In the UK they use a guideline of 100 nano grams per litre of Pfas in drinking water , in Sweden it is 4 nanograms per litre 4ng/L or 4 ppt as it's also known , ( parts per trillion). Although these levels sound incredibly low they are known to cause serious adverse health effects at low exposure levels. In Denmark they have a limit of 2 ng/L and in the USA it is 4

Please consider these things when deciding on what level of information should be supplied for water we buy. It's not just about money or how often we are asked to pay , it's about what are we being asked to pay for ?

I Thank you for considering my submission.

I can provide supporting documentation and evidence if it helps you or the community

We all drink the same water and we all wash in it and cook with it.

Kind regards
